

**WILDLIFE FEEDERS**

## **Support Cable Kit Instructions**

### **WARNING:**

To prevent serious injury or death, always check the cable and all hardware during installation and before each use.

Discontinue use immediately if the cable or hardware is loose or worn. **NEVER** walk under a hanging feed container.

Use extreme caution when working at elevated heights.

### **FEATURES:**

This fifty-foot (50') length of 1,700 pound rated outdoor cable with four (4) cable clamps is an ideal aid for mounting an overhead feed container in areas where bears or other nuisance animals are present.

### **MOUNTING:**

It is suggested that overhead feed containers be secured between two trees that are at least twenty-five feet (25') apart, and that the feeder when installed be a minimum of eight feet (8') above the ground.

This cable **MUST** be wrapped around each tree a minimum of three (3) times to offer maximum holding strength.

A minimum of four (4) cable clamps (2 on each end) **MUST** firmly secure the loose ends of the cable to the cable stretched between two trees.

Additional means for lifting the feed container are not provided with this kit and are up to the installer to provide.
